Summary

Economics PhD candidate (University of British Columbia, May 2027) specializing in discrete choice and demand estimation: how people choose when they evaluate only part of the options in front of them, as on a ranked list, a search result, or a marketplace feed. I build and estimate structural models in Julia and Python, prove when the underlying parameters can be recovered from data, and deliver valid uncertainty estimates. Undergraduate training in accounting alongside economics.

Skills

Programming	Julia, Python (pandas, NumPy), R, Stata, SQL, $\text{\LaTeX}$
Methods	Discrete choice and demand estimation; structural estimation (GMM, maximum likelihood, sieve and semiparametric methods); identification; causal inference; inference under parameter constraints
Domains	Consumer and worker choice under limited attention; search and matching markets; online labor platforms

Research Experience

PhD Researcher, Vancouver School of Economics, University of British Columbia Sept 2021 – present

- Developed methods to separate differences in preferences from costly information acquisition using only aggregate choice data (choice shares), so analysts can tell whether users ignore an option because they dislike it or because they never evaluated it.
- Proved identification results and built a sieve minimum-distance estimator with confidence regions that remain valid when estimates hit parameter boundaries, where standard normal-approximation inference breaks down.
- Applied the model to Amazon Mechanical Turk data to quantify how information costs shape workers' responses to wages on an online labor platform.
- Built an equilibrium model of job search in which workers pay to learn about wages before applying; proved equilibrium existence and derived closed-form identification of attention costs.
- Presented at the Econometric Society North American Summer Meeting (2026) and the Canadian Economics Association conference (2026); referee for the *Journal of Econometric Methods*.

Research Assistant, University of British Columbia (Prof. Kyungchul Song) Sept 2024 – May 2025

- Supported research in econometric methods.

Teaching Assistant, Vancouver School of Economics, University of British Columbia Sept 2020 – Aug 2026

- Taught tutorials for ten terms of undergraduate courses, including introductory and advanced econometrics and empirical methods; ran hands-on R and Python sessions and explained technical results to non-specialists.

Education

Ph.D. in Economics, University of British Columbia 2021 – May 2027 (expected)

Four Year Doctoral Fellowship (merit-based), 2022–2026

M.A. in Economics, University of British Columbia 2021

B.M.O.S. (Honors), Accounting and Economics, Western University 2020

Board of Directors' Gold Medal (highest final-year average in the program); Dean's Honor List, 2016–2019

Languages

English (fluent), Mandarin Chinese (native)
